An undergarment for accommodating an external medical device is provided. The undergarment includes a front portion, a rear portion; a crotch portion, a waist opening; at least two leg openings, and at least one pocket defined by at least one piece of fabric secured to the front portion upon an exterior of the undergarment. At least one opening is provided between the piece of fabric and the front portion, and at least one aperture is located in proximity to a corner formed near to upper border and an inner side border of one pocket. The at least one pocket is positioned at the front portion of the undergarment in a slanted fashion. A lower border of the pocket forms an angle of between about 15 and about 30 degrees with respect to a horizontal line extended across the undergarment and, preferably, an angle of about 22 degrees.
